

type transmission lines.

4. A reception circuit for receiving a transmission signal in a communication system utilizing two-wire type transmission lines for transmitting transmission signals in opposite phases, comprising:

an AC coupling circuit for extracting AC components in a transmission signal input through said transmission lines;

a bias circuit for applying a bias voltage to a signal output from said AC coupling circuit; and

a clip circuit for clipping the level of a signal output from said bias circuit associated with each of said two-wire type transmission lines.
